1

The University of New Mexico

## Objectives

- Introduce the basic input devices
  - Physical Devices
  - Logical Devices
  - Input Modes
- Event-driven input
- Introduce double buffering for smooth animations
- Programming event input with GLUT

## Project Sketchpad

- Ivan Sutherland (MIT 1963) established the basic interactive paradigm that characterizes interactive computer graphics:
  - User sees an *object* on the display
  - User points to (*picks*) the object with an input device (light pen, mouse, trackball)
  - Object changes (moves, rotates, morphs)
  - Repeat

## Graphical Input

- Devices can be described either by
  - Physical properties
    - Mouse
    - Keyboard
    - Trackball
  - Logical Properties
    - What is returned to program via API
      - A position
      - An object identifier
- Modes
  - How and when input is obtained
    - Request or event

4

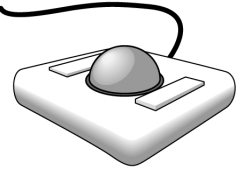

The University of New Mexico

## Physical Devices

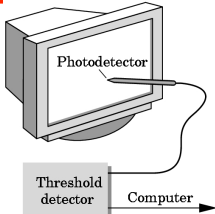

---

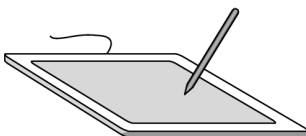

mouse

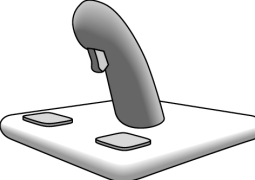

trackball

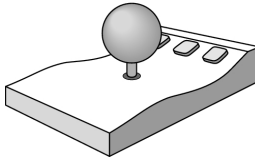

light pen

data tablet

joy stick

space ball

5

The University of New Mexico

## Incremental (Relative) Devices

---

- Devices such as the data tablet return a position directly to the operating system
- Devices such as the mouse, trackball, and joy stick return incremental inputs (or velocities) to the operating system
  - Must integrate these inputs to obtain an absolute position
    - Rotation of cylinders in mouse
    - Roll of trackball
    - Difficult to obtain absolute position
    - Can get variable sensitivity

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

6

## Logical Devices

- Consider the C and C++ code
  - C++: `cin >> x;`
  - C: `scanf ("%d", &x);`
- What is the input device?
  - Can't tell from the code
  - Could be keyboard, file, output from another program
- The code provides *logical input*
  - A number (an `int`) is returned to the program regardless of the physical device

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

7

## Graphical Logical Devices

- Graphical input is more varied than input to standard programs which is usually numbers, characters, or bits
- Two older APIs (GKS, PHIGS) defined six types of logical input
  - **Locator**: return a position
  - **Pick**: return ID of an object
  - **Keyboard**: return strings of characters
  - **Stroke**: return array of positions
  - **Valuator**: return floating point number
  - **Choice**: return one of n items

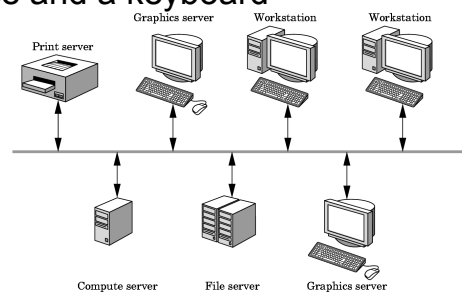

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

8

## X Window Input

- The X Window System introduced a client-server model for a network of workstations
  - **Client:** OpenGL program
  - **Graphics Server:** bitmap display with a pointing device and a keyboard

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

9

## Input Modes

- Input devices contain a *trigger* which can be used to send a signal to the operating system
  - Button on mouse
  - Pressing or releasing a key
- When triggered, input devices return information (their *measure*) to the system
  - Mouse returns position information
  - Keyboard returns ASCII code

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

1  
0

## Request Mode

- Input provided to program only when user triggers the device
- Typical of keyboard input
  - Can erase (backspace), edit, correct until enter (return) key (the trigger) is depressed

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

1  
1

## Event Mode

- Most systems have more than one input device, each of which can be triggered at an arbitrary time by a user
- Each trigger generates an *event* whose measure is put in an *event queue* which can be examined by the user program

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

1  
2

## Event Types

- Window: resize, expose, iconify
- Mouse: click one or more buttons
- Motion: move mouse
- Keyboard: press or release a key
- Idle: nonevent
  - Define what should be done if no other event is in queue

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

1  
3

## Callbacks

- Programming interface for event-driven input
- Define a *callback function* for each type of event the graphics system recognizes
- This user-supplied function is executed when the event occurs
- GLUT example: **glutMouseFunc**  
**(mymouse)**

mouse callback function

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

4

## GLUT callbacks

GLUT recognizes a subset of the events recognized by any particular window system (Windows, X, Macintosh)

- `glutDisplayFunc`
- `glutMouseFunc`
- `glutReshapeFunc`
- `glutKeyboardFunc`
- `glutIdleFunc`
- `glutMotionFunc`,
- `glutPassiveMotionFunc`

## GLUT Event Loop

- Recall that the last line in `main.c` for a program using GLUT must be

```
glutMainLoop();
```

which puts the program in an infinite event loop

- In each pass through the event loop, GLUT
  - looks at the events in the queue
  - for each event in the queue, GLUT executes the appropriate callback function if one is defined
  - if no callback is defined for the event, the event is ignored

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

1  
6

## The display callback

- The display callback is executed whenever GLUT determines that the window should be refreshed, for example
  - When the window is first opened
  - When the window is reshaped
  - When a window is exposed
  - When the user program decides it wants to change the display
- In **main.c**
  - `glutDisplayFunc(mydisplay)` identifies the function to be executed
  - Every GLUT program must have a display callback

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

1  
7

## Posting redispays

- Many events may invoke the display callback function
  - Can lead to multiple executions of the display callback on a single pass through the event loop
- We can avoid this problem by instead using `glutPostRedisplay()`; which sets a flag.
- GLUT checks to see if the flag is set at the end of the event loop
- If set then the display callback function is executed

1  
8

## Animating a Display

- When we redraw the display through the display callback, we usually start by clearing the window
  - `glClear()`
 then draw the altered display
- Problem: the drawing of information in the frame buffer is decoupled from the display of its contents
  - Graphics systems use dual ported memory
- Hence we can see partially drawn display
  - See the program `single_double.c` for an example with a rotating cube

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

1  
9

## Double Buffering

- Instead of one color buffer, we use two
  - **Front Buffer**: one that is displayed but not written to
  - **Back Buffer**: one that is written to but not displayed
- Program then requests a double buffer in `main.c`
  - `glutInitDisplayMode(GL_RGB | GL_DOUBLE)`
  - At the end of the display callback buffers are swapped

```
void mydisplay()
{
    glClear(GL_COLOR_BUFFER_BIT|... )
    .
    /* draw graphics here */
    .
    glutSwapBuffers()
}
```

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

## Using the idle callback

- The idle callback is executed whenever there are no events in the event queue

- `glutIdleFunc(myidle)`
- Useful for animations

```
void myidle() {
    /* change something */
    t += dt
    glutPostRedisplay();
}
```

```
void mydisplay() {
    glClear();
    /* draw something that depends on t */
    glutSwapBuffers();
}
```

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

2  
1

## Using globals

- The form of all GLUT callbacks is fixed
  - `void mydisplay()`
  - `void mymouse(GLint button, GLint state, GLint x, GLint y)`
- Must use globals to pass information to callbacks

```
float t; /*global */
```

```
void mydisplay()
{
    /* draw something that depends on t
}
```
