

Working with Callbacks

Angel: Interactive Computer Graphics 5E $\ensuremath{\mathbb{C}}$ Addison-Wesley 2009

.

Objectives

- Learn to build interactive programs using GLUT callbacks
 - Mouse
 - Keyboard
 - Reshape
- Introduce menus in GLUT

Angel: Interactive Computer Graphics 5E $\ensuremath{\mathbb{C}}$ Addison-Wesley 2009

The mouse callback

glutMouseFunc(mymouse)
void mymouse(GLint button, GLint
state, GLint x, GLint y)

- Returns
 - which button (GLUT_LEFT_BUTTON,
 GLUT_MIDDLE_BUTTON,
 GLUT_RIGHT_BUTTON) caused event
 - state of that button (GLUT UP, GLUT DOWN)
 - Position in window

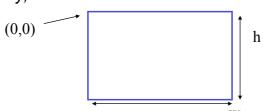

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

:

Positioning

- The position in the screen window is usually measured in pixels with the origin at the top-left corner
 - Consequence of refresh done from top to bottom
- OpenGL uses a world coordinate system with origin at the bottom left
 - Must invert y coordinate returned by callback by height of window
 - y = h y;

Angel: Interactive Computer Graphics 5E $\ensuremath{\mathbb{C}}$ Addison-Wesley 2009

Obtaining the window size

- To invert the y position we need the window height
 - Height can change during program execution
 - Track with a global variable
 - New height returned to reshape callback that we will look at in detail soon
 - Can also use query functions
 - glGetIntv
 - glGetFloatv

to obtain any value that is part of the state

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

.

Terminating a program

- In our original programs, there was no way to terminate them through OpenGL
- •We can use the simple mouse callback

```
void mouse(int btn, int state, int x, int y)
{
   if(btn==GLUT_RIGHT_BUTTON && state==GLUT_DOWN)
      exit(0);
}
```

Angel: Interactive Computer Graphics 5E $\ensuremath{\mathbb{C}}$ Addison-Wesley 2009

Using the mouse position

- In the next example, we draw a small square at the location of the mouse each time the left mouse button is clicked
- This example does not use the display callback but one is required by GLUT; We can use the empty display callback function
 mydisplay() {}

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

7

Drawing squares at cursor location

```
void mymouse(int btn, int state, int x, int y)
{
   if(btn==GLUT_RIGHT_BUTTON && state==GLUT_DOWN)
       exit(0);
   if(btn==GLUT_LEFT_BUTTON && state==GLUT_DOWN)
       drawSquare(x, y);
}
void drawSquare(int x, int y)
{
   y=w-y; /* invert y position */
   glColor3ub( (char) rand()%256, (char) rand )%256,
       (char) rand()%256); /* a random color */
   glBegin(GL_POLYGON);
       glVertex2f(x+size, y+size);
       glVertex2f(x-size, y+size);
       glVertex2f(x-size, y-size);
       glVertex2f(x+size, y-size);
       glVertex2f(x+size, y-size);
       glEnd();
}

```

raphics 5E © Addison-Wesley 2009

Using the motion callback

- We can draw squares (or anything else) continuously as long as a mouse button is depressed by using the motion callback
 - -glutMotionFunc(drawSquare)
- We can draw squares without depressing a button using the passive motion callback
 - -glutPassiveMotionFunc(drawSquare)

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

Using the keyboard

```
glutKeyboardFunc(mykey)
void mykey (unsigned char key,
       int x, int y)
```

- Returns ASCII code of key depressed and mouse location

```
void mykey()
     if(key == Q' | key == q')
         exit(0);
```

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

Special and Modifier Keys

- GLUT defines the special keys in glut.h
 - Function key 1: GLUT KEY F1
 - Up arrow key: GLUT_KEY_UP
 if (key == `GLUT_KEY_F1'
- Can also check of one of the modifiers
 - -GLUT ACTIVE SHIFT
 - -GLUT ACTIVE CTRL
 - -GLUT ACTIVE ALT

is depressed by

glutGetModifiers()

- Allows emulation of three-button mouse with one- or two-button mice

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

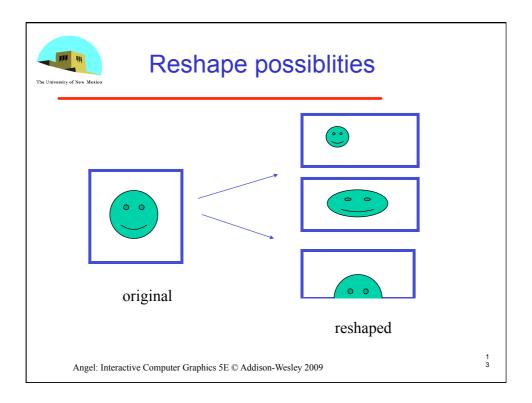

.

Reshaping the window

- We can reshape and resize the OpenGL display window by pulling the corner of the window
- What happens to the display?
 - Must redraw from application
 - Two possibilities
 - Display part of world
 - · Display whole world but force to fit in new window
 - Can alter aspect ratio

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

The Reshape callback

glutReshapeFunc (myreshape)

void myreshape(int w, int h)

- Returns width and height of new window (in pixels)
- A redisplay is posted automatically at end of execution of the callback
- GLUT has a default reshape callback but you probably want to define your own
- The reshape callback is good place to put viewing functions because it is invoked when the window is first opened

Angel: Interactive Computer Graphics 5E $\ensuremath{\mathbb{C}}$ Addison-Wesley 2009

Example Reshape

 This reshape preserves shapes by making the viewport and world window have the same aspect ratio

Toolkits and Widgets

- Most window systems provide a toolkit or library of functions for building user interfaces that use special types of windows called widgets
- · Widget sets include tools such as
 - Menus
 - Slidebars
 - Dials
 - Input boxes
- But toolkits tend to be platform dependent
- GLUT provides a few widgets including menus

Angel: Interactive Computer Graphics 5E $\ensuremath{\mathbb{C}}$ Addison-Wesley 2009

Menus

- GLUT supports pop-up menus
 - A menu can have submenus
- Three steps
 - Define entries for the menu
 - Define action for each menu item
 - · Action carried out if entry selected
 - Attach menu to a mouse button

Angel: Interactive Computer Graphics 5E ${\rm @}$ Addison-Wesley 2009

7

Defining a simple menu

• In main.c

```
menu_id = glutCreateMenu(mymenu);
glutAddmenuEntry("clear Screen", 1);
gluAddMenuEntry("exit", 2);
glutAttachMenu(GLUT_RIGHT_BUTTON);
```

clear screen

exit

entries that appear when right button depressed

identifiers

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

Menu actions

- Menu callback

```
void mymenu(int id)
{
    if(id == 1) glClear();
    if(id == 2) exit(0);
}
```

- Note each menu has an id that is returned when it is created
- Add submenus by

```
glutAddSubMenu(char *submenu name, submenu id)
```

entry in parent menu

Angel: Interactive Computer Graphics 5E © Addison-Wesley 2009

Other functions in GLUT

- Dynamic Windows
 - Create and destroy during execution
- Subwindows
- Multiple Windows
- Changing callbacks during execution
- Timers
- Portable fonts
 - -glutBitmapCharacter
 - -glutStrokeCharacter
